EXECUTIVE SUMMARY

Alta Environmental DBA NV5 (NV5) conducted monitoring services during the removal of polychlorinated biphenyl (PCB) impacted building materials (caulking, mastics, and associated porous substrates) prior to demolition of Building D at Malibu High School located at 30215 Morning Drive, Malibu, California 90265. This work was performed on behalf of the Santa Monica-Malibu School District (District). NV5 monitoring included the following:

- Review of contractor abatement plan prior to start of the remediation work;
- Review of contractor engineering controls including area isolation, removal methods, worker protection, and waste disposal to verify compliance with applicable removal specifications and work plan requirements;
- Particulate sampling using real-time monitors at fence line perimeters of the work area and the school campus; and
- Confirmational final visual inspection to verify identified PCB-impacted materials were properly removed, including associated dust and debris.

During this project, identified PCB Bulk Product Wastes and PCB Remediation Wastes were removed and properly disposed during the Building D demolition activities. The removal activities were conducted in accordance with the following plans: USEPA-approved *PCB Remediation Waste Plan – Buildings D, F, G, I and J* dated April 13, 2018 and the USEPA-approved *Notification and Request for Approval, Site-Specific PCB Remediation Waste Plan, Building D, Malibu High School, Malibu, California* dated March 27, 2020 (collectively identified as the “Work Plan”).

- Appendix C: Work Area and Perimeter Dust Monitoring Data

1.0 PROJECT BACKGROUND

Alta Environmental DBA NV5 (NV5) conducted monitoring services during the removal of identified polychlorinated biphenyl (PCB) impacted building materials consisting of select window and door caulking, louver caulking, and flooring adhesive to facilitate demolition of Building D at the Malibu High School campus located at 30215 Morning Drive, Malibu, California (Site). This report details the activities conducted by Miller Environmental (Miller) for the removal, segregation and subsequent disposal of these materials and adjoining PCB-impacted porous materials during demolition of the building.

2.0 NV5 PROJECT SCOPE OF SERVICES

At the request of the Santa Monica-Malibu School District (District), NV5 provided the following services during the removal/remediation:

- Contractor observation to document project activities including the contractor’s adherence to work plan requirements as outlined in the United States Environmental Protection Agency (USEPA) approved *Site-Specific PCB Remediation Waste Plan, Building D, Malibu High School Malibu, California* dated March 27, 2020 (Ramboll, 2020) and requirements listed in the USEPA approval letter signed April 23, 2020 (herein collectively identified as the “Work Plan”).
- Perimeter fence line and work area air monitoring for airborne particulates using data-logging real-time monitors.
- Final post-removal visual inspection of each controlled work area.

Project removal activities were conducted from May 20, 2020 through June 21, 2020.

3.0 CONTRACTOR PERFORMED REMOVAL ACTIVITIES

Miller Environmental (Miller), the District’s demolition contractor, removed identified PCB-impacted building materials known to contain PCB concentrations greater than 50 parts per million (ppm). In addition, adjoining porous materials with concentrations great than 1 mg/Kg were also removed. All PCB removal activities and waste segregation, storage, and disposal were conducted in accordance with the Work Plan.

Material Designated for Removal	Location
Window and Door Caulking and Associated Brick	West Elevation Storefront Window System
Louver/Vent Caulking and Associated Brick	West Elevation; North and South Elevations
12”x 12” Floor Tiles with PCB-Containing Adhesive/Mastic	First and Second Floor Classrooms, Labs, and Storage areas

Figures depicting the PCB-impacted building materials identified for removal are presented in Appendix A.

3.1 REGULATED WORK AREA

The work areas for Building D were established around the designated PCB removal areas. Physical barriers and warning signs were utilized to limit access to only those authorized persons conducting or monitoring the remediation work. The PCB removal areas were further isolated by installing additional containment systems consisting of critical and perimeter barriers constructed with fire retardant polyethylene sheeting.

In addition, all nearby storm water drains were sealed, and sandbags placed around their perimeter.

3.2 ENGINEERING CONTROLS

The PCB removal area containment systems were constructed to minimize the potential for airborne dust to migrate outside the regulated work areas. Negative air pressures were established within each containment using high-efficiency particulate air (HEPA) filtering fan units to maintain a minimum air pressure differential of -0.02 inches/water column. The containment area pressure differential was continuously monitored during PCB removal activities using a data-logging manometer. Additional engineering controls included the use of HEPA filter-equipped vacuums within the containment systems to collect dust generated during the remediation activities.

3.3 CAULKING REMOVAL

As discussed in the Work Plan, previous investigations of Building D identified concentrations of PCBs greater than 50 ppm in wall joint caulking associated with select window, door, and louver assemblies installed in the exterior walls of Building D. In addition, PCB impacts greater 1 ppm were identified in the porous substrates adjoining these building components due to migration of PCBs from the original source material (caulking). While the extent of adjoining porous material impact is identified as less than 6-inches from the subject building components, Miller extended the removal to a minimum distance of 16-inches around each of the vent, door and window assemblies due to structural constraints with the building design.

Temporary wall shoring consisting of metal I-beams were installed in the wall system to facilitate safe removal of the target building components. Miller then used powered demolition saws and wet cutting methods to perforate the porous substrate surrounding target building components. Each building component assembly and adjoining porous substrate were removed as a unit, to the extent practicable.

Following removal activities, Miller and NV5 field personnel performed a final visual inspection of the containment areas. Once the areas were found to be acceptably free of PCB-impacted materials, dust and other debris, the work area containment was removed to facilitate subsequent building demolition activities.

All PCB-impacted caulking removal activities were performed in accordance with the Work Plan.

3.4 FLOORING MASTIC

As discussed in the Work Plan, previous investigations of Building D identified PCB-impacted flooring mastic and adhesives with concentrations greater than 50 ppm within select locations on the first and second floor of Building D.

Miller pre-wet the target flooring surfaces and utilized metal scrapers and similar manual tools to separate and remove the PCB-impacted flooring materials. Following bulk removal, detailed cleaning of remaining residue was performed (without the use of solvents).

Upon completion of removal activities, Miller and NV5 field personnel performed a visual inspection of the exposed concrete slab on both floors. Once the areas were found to be acceptably free of PCB-impacted materials, dust and debris, NV5 collected shallow core samples from the concrete slab to assess PCB concentrations in the porous substrate. Each concrete sample was collected with a core drill to a depth of approximately 0.5-inches. The recovered concrete material was transferred to laboratory-supplied sample containers and submitted to a California-accredited environmental testing laboratory. All concrete samples were prepared for analysis by the laboratory using EPA Method 3540 (Soxhlet extraction) and analyzed for PCBs using EPA Method TO-10A.

Laboratory sample results indicated concentrations greater than 1ppm at select locations within the first and second floor concrete slab. Summary data tables and figures depicting the post-removal concrete core sampling locations and laboratory results are presented in Appendix A.

3.4.1 Bead-blasting Pilot Study

Following removal of all identifiable flooring mastic from Building D, a pilot-study was conducted to assess the effectiveness of bead-blasting and scabbling removal methods for the upper layers of the concrete slab impacted with PCB concentrations above 1 ppm. Bead-blasting is a type of surface preparation that uses steel balls of varying diameters to strip off the upper layers of concrete, while scabbling uses percussive carbide-tipped rods to chip away shallow layers of concrete. Each bead-blasting pass removed approximately 0.125-inches of substrate, while each pass of the scabblers removed approximately 0.25-inches.

Bead-blasting and scabbling of the concrete surfaces was performed within full work area containment and with appropriate negative air pressure differentials maintained. After multiple bead-blasting and scabbling passes, concrete core samples indicated the remaining PCB concentrations in the 1st floor slab were below 1 ppm, meeting the disposal characterization requirements for general construction and demolition waste. However, concrete core samples collected from the 2nd floor slab remained above 1 ppm within Rooms 205, 209, 211 and 212. Due to structural concerns, additional passes were not performed and the entire remaining 2nd floor concrete slab was removed and characterized for disposal as PCB Remediation Waste in accordance with 40 CFR 761.62 (see Section 9 for additional details).

Summary data tables and figures depicting post-bead blasting sample locations and results are presented as Appendix B.

4.0 PERIMETER SAMPLING/AIR MONITORING-RESPIRABLE AIRBORNE PARTICULATES

Airborne particulate sampling was conducted using DustTrak2 Model 8530 battery operated, direct read data logging instruments which measure real-time concentrations of PM₁₀. The monitors were equipped with a heated inlet tube to mitigate moisture influence (which is known to cause false elevated readings), an external battery backup, and telemetry. The instruments were contained within dedicated tripod-mounted housings approximately 5-feet above ground surface and were sited at locations upwind and downwind of the immediate work area (Work Area) and at locations along the Malibu High School campus property boundary (Perimeter).

The instruments were deployed to collect PM₁₀ concentration data while PCB remediation activities were in progress. The instruments were checked at a minimum frequency of once per hour and data from the instruments was reviewed regularly throughout each workday. Meteorological data including temperature, wind speed, and direction were obtained by NV5 from the nearest weather station listed online at <https://www.wunderground.com/dashboard/pws/KCAMALIB11>

In accordance with the Work Plan, the PM₁₀ action level for dust potentially containing PCBs was established as 0.050 mg/m³, without consideration of ambient or upwind conditions. Therefore, the PM₁₀ dust monitoring results observed during the PCB removal project were susceptible to elevated PM₁₀ concentrations originating from unrelated sources, including the active new building construction site (Building A/B/C) adjoining the Building D work area.

Temporary PM₁₀ concentration increases at the Work Area monitoring locations were observed during times when other activities including welding (metal fumes), roofing (hot tar fumes), vehicle traffic (non-PCB particulates), and landscaping (mowing, leaf blower) were being performed near Building D. Temporary PM₁₀ concentration increases at the Perimeter monitoring locations were also observed periodically when landscaping activities were performed nearby and during periods of heavy neighborhood and Building A/B/C construction vehicle traffic. No sources of PM₁₀ concentrations greater than 50 µg/m³ were identified as attributable to PCB removal activities occurring at Building D.

While all practicable methods were utilized to ensure the dust monitoring instruments collected and recorded PM₁₀ concentrations as designed, instrument and/or data failure occurred periodically during the project. However, visible dust originating from PCB removal work activities was not observed near to or crossing the work area boundary at any time during this project. The project successfully met the Work Plan dust control objectives.

Appendix C presents a figure depicting the monitoring locations and data tables providing daily summaries of PM₁₀ concentrations detected at each of the seven monitoring locations established for this project.

5.0 WORKER PROTECTION

Personal protective equipment utilized by workers engaged in the PCB remediation activities included NIOSH-approved half-face air-purifying respirators with HEPA (P100) cartridges, disposable non-porous protective overalls, and eye, hand, foot and hearing protection devices.

6.0 WORKER DECONTAMINATION

A three-stage worker decontamination unit, integral to each work area containment, was placed at the entrance to the regulated work area and included a “dirty” room, shower room and a clean room. The decontamination facility was equipped with soap and towels.

7.0 EQUIPMENT DECONTAMINATION

Equipment used for PCB removal/remediation was wet wiped and vacuumed with HEPA-equipped vacuums and visually inspected prior to removal from the work areas. In addition, the HEPA filters from all equipment, vacuums and negative air blowers were removed inside each containment, and the interior of the unit (filter compartment) was wet wiped prior to removal from the containment areas. Following decontamination, all equipment, including tools, vacuums, and air filtration devices were visually inspected prior to removal from the work areas.

8.0 QUALITY CONTROL

Sample collection and analytical methodologies used to complete this project were performed according to the Work Plan. All samples collected during this project were prepared and analyzed by a certified and accredited laboratory in accordance with EPA Method 3540 (as applicable) and EPA Method 8082. NV5 reviewed all laboratory data for quality and usability in accordance with appropriate USEPA protocols. Based on a review of the laboratory QC data associated with the sample analysis, the recovery and precision were within the acceptable limits of the laboratory.

9.0 WASTE MANAGEMENT AND DISPOSAL

Waste generated from the project activities was packaged, labeled, stored and disposed in accordance with the Work Plan. Separate staging and storage areas were appropriately maintained for each of the PCB Remediation Waste and PCB Bulk Product Waste streams.

PCB Remediation Waste consisting of solid materials was hauled as a non-hazardous waste by ARO Trucking to the Waste Management Simi Valley facility located at 2801 Madera Road in Simi Valley, California. This waste stream included PCB-containing concrete and bead blasting media.

PCB Remediation Waste consisting of liquid materials was hauled as a non-hazardous waste by Environmental Contractors Transportation, Inc. to the US Ecology facility located on Hwy 95, 11 miles south of Beatty, Nevada. This waste stream included PCB-containing slurry generated during saw cutting around the vent, window, and door assemblies which were removed during this project.

PCB Bulk Product Waste was hauled as a hazardous waste by EDC Specialty Services and ARO Trucking to the US Ecology facility located on Hwy 95, 11 miles south of Beatty, Nevada. This waste stream included brick and concrete containing PCB-impacted caulking.

10.0 PROJECT SUMMARY

PCB-related work completed during this project was done so in accordance with the Work Plan. Visual inspections confirmed that materials designated for removal were removed and that no visible dust or debris resulting from the removal activities was observed crossing the Building D work area boundary.

11.0 DISCLAIMER

This report was prepared exclusively for use by the Santa Monica-Malibu Unified School District and may not be relied upon by any other person or entity without NV5 express written permission. The information, conclusions and recommendations described in this report apply to conditions existing at certain locations when services were performed and are intended only for the specific purposes, locations, time frames and project parameters indicated. NV5 cannot be responsible for the impact of any changes in environmental standards, practices or regulations after performance of services.

In performing our professional services, we have applied engineering and scientific judgment and used a level of effort consistent with the current standard of practice for similar types of studies.

As applicable, NV5 has relied in good faith upon representations and information furnished by individuals with respect to operations and existing property conditions, to the extent that they have not been contradicted by data obtained from other sources. Accordingly, NV5 accepts no responsibility for any deficiencies, omissions, misrepresentations, or fraudulent acts of persons interviewed.

NV5 will not accept any liability for loss, injury claim, or damage arising directly or indirectly from any use or reliance on this report. NV5 makes no warranty, expressed or implied.
